

Beat The Winter Blues

SHEDDING LIGHT ON SEASONAL SADNESS

As the days get shorter, many people find themselves feeling sad. You might feel blue around the winter holidays, or get into a slump after the fun and festivities have ended. Some people have more serious mood changes year after year, lasting throughout the fall and winter when there's less natural sunlight. What is it about the darkening days that can leave us down in the dumps? And what can we do about it?

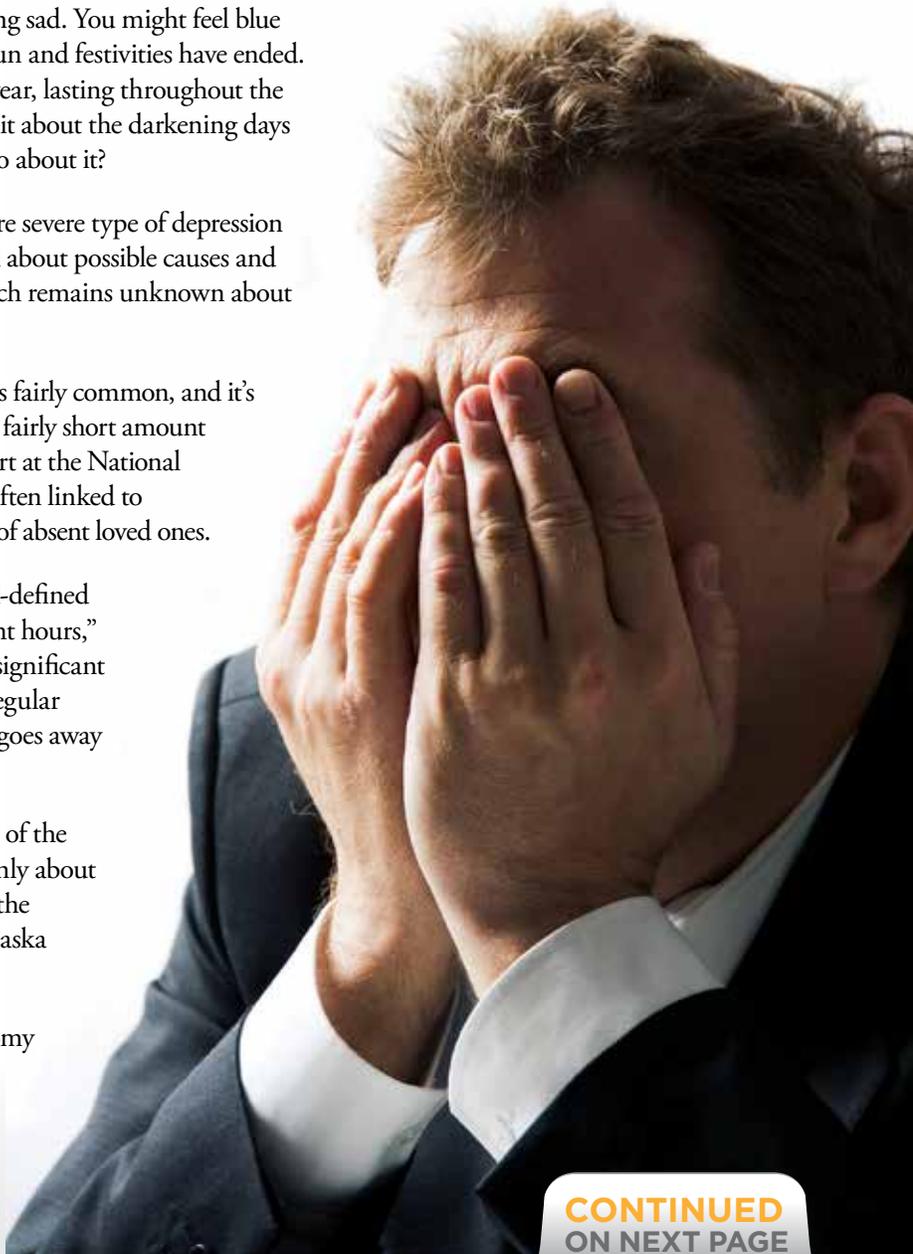

Scientists have been studying the "winter blues" and a more severe type of depression called seasonal affective disorder, or SAD. They've learned about possible causes and found treatments that seem to help most people. Still, much remains unknown about these winter-related shifts in mood.

"Winter blues is a general term, not a medical diagnosis. It's fairly common, and it's more mild than serious. It usually clears up on its own in a fairly short amount of time," says Dr. Matthew Rudorfer, a mental health expert at the National Institute of Health (NIH). The so-called winter blues are often linked to something specific, such as stressful holidays or reminders of absent loved ones.

"Seasonal affective disorder, though, is different. It's a well-defined clinical diagnosis that's related to the shortening of daylight hours," says Rudorfer. "It interferes with daily functioning over a significant period of time." A key feature of SAD is that it follows a regular pattern. It appears each year as the seasons change, and it goes away several months later, usually during spring and summer.

SAD is more common in northern than in southern parts of the United States, where winter days last longer. "In Florida only about 1% of the population is likely to suffer from SAD. But in the northernmost parts of the U.S, about 10% of people in Alaska may be affected," says Rudorfer.

As with other forms of depression, SAD can lead to a gloomy outlook and make people feel hopeless, worthless and irritable. They may lose interest in activities they used to enjoy, such as hobbies and spending time with friends.

What Triggers SAD?

Shorter days seem to be a main trigger for SAD. Reduced sunlight in fall and winter can disrupt your body's internal clock, or circadian rhythm. This 24-hour "master clock" responds to cues in your surroundings, especially light and darkness. During the day, your brain sends signals to other parts of the body to help keep you awake and ready for action. At night, a tiny gland in the brain produces a chemical called melatonin, which helps you sleep. Shortened daylight hours in winter can alter this natural rhythm and lead to SAD in certain people.

How Can SAD Be Treated?

NIH researchers first recognized the link between light and seasonal depression back in the early 1980s. These scientists pioneered the use of light therapy, which has since become a standard treatment for SAD. "Light therapy is meant to replace the missing daylight hours with an artificial substitute," says Rudorfer.

LIFT YOUR MOOD

These "self-care" tips might help with seasonal depression. See a mental health professional if sadness doesn't go away or interferes with your daily life:

- Go to a movie, take a walk, go ice-skating or do other activities you normally enjoy.
- Get out in the sunlight or brightly lit spaces, especially early in the day.
- Try to spend time with other people and confide in a trusted friend or relative.
- Eat nutritious foods, and avoid overloading on carbohydrates like cookies and candies.
- Be patient. You won't suddenly "snap out of" depression. Your mood will improve gradually.
- If you have thoughts of suicide, get help right away. Call the toll-free National Suicide Prevention Lifeline at 1-800-273-TALK (8255).

In light therapy, patients generally sit in front of a light box every morning for 30 minutes or more, depending on the doctor's recommendation. The box shines light much brighter than ordinary indoor lighting. Studies have shown that light therapy relieves SAD symptoms for as much as 70% of patients after a few weeks of treatment. Some improvement can be detected even sooner.

Growing evidence suggests that cognitive behavioral therapy (CBT)—a type of talk therapy—can also help patients who have SAD. The "behavioral" part of CBT tries to teach people new behaviors to engage in when they're feeling depressed, to help them feel better.

If you're feeling blue this winter, and if the feelings last for several weeks, talk to a health care provider. "It's true that SAD goes away on its own, but that could take FIVE months or more. Five months of every year is a long time to be impaired and suffering," says Rudorfer. "SAD is generally quite treatable, and the treatment options keep increasing and improving."
